This exercise augments classroom discussion of the modular design of a project, and community standards.

1. List the members of your group below. Underline your name.

2. Briefly explain the *onion method* of organizing tasks. Identify constraints and features that are important for its effective use. Use an illustrative example, preferably from your own project.

3. Identify and briefly explain community standards for the following: version control workflows (not mechanisms); code packaging and distribution; code reuse and attribution; end-user documentation; programmer documentation.
